

Weekly Influenza Summary:

The first laboratory-confirmed case of influenza in the 2008-'09 season was reported to the Arizona Department of Health Services on Wednesday, 11/19/2008, and Arizona is reporting sporadic influenza activity to CDC for the week ending 11/22/2008. The case has been PCR-confirmed as influenza A(H1), and is an infant from Maricopa County who is now recovering at home. A second confirmed case was reported later in the week, also from Maricopa County. An increase in influenza-like-illness (ILI) activity was noted amongst participating sentinel surveillance sites for the week ending 11/15/2008 (week 46), but a small number of sentinel providers reported for that week and, therefore, this may not be representative for the entire state.

Data in this report are provisional and may change as more reports are received.

National influenza surveillance data are available at the CDC's Influenza Surveillance site (<http://www.cdc.gov/flu/weekly/fluactivity.htm>).

Arizona Influenza Activity Levels

The graph below shows the influenza activity levels reported to the CDC for this season only. For week 47, Arizona reported "sporadic activity". Definitions of these reporting categories can be found at <http://www.cdc.gov/flu/weekly/fluactivity.htm>.

Influenza-Like Illness (ILI) Surveillance from Sentinel Providers

The proportion of patient visits to sentinel providers for ILI in the state was 1.7% for the week ending 11/15/2008 (week 46), higher than the state baseline of 0.5%. As of

11/24/08, 13 sentinel providers have reported by the end of week 46. It is important to note that participation amongst sentinel providers significantly lessens during the summer months or during the non-peak influenza activity months. Therefore, the noted ILI proportion may not be representative for the entire state of Arizona during week 46.

ILI is defined as a fever of at least 100°F plus either a cough or a sore throat.

Influenza-Like Illness (ILI) Surveillance from Participating Arizona Schools

ADHS and the Arizona School Nurse Consortium (AZSNC) developed and implemented a software program called Child Health Indicator Program (CHIP) to assist school nurses in electronic management of student health records. Currently, nurses in 331 Arizona schools use the software to collect information on student health conditions for 266 nursing diagnosis codes, including influenza-like illness (ILI), rash, and gastrointestinal illness (GI).

The graph presents the weekly trend of ILI syndromes reported among students during the school years of 2006-2007, 2007-2008, and 2008-2009. The number of school nurse encounters are not diagnosed cases of communicable diseases but are based on the nursing codes that school nurses enter to track student conditions. Also, the numbers in the graph are only from schools that used CHIP during the school year.

Influenza-Like Illness Per School Enrollment in Arizona (per 100,000)

RSV summary is continued on the following pages.

RSV Activity in Arizona:

As of 11/24/2008, 18 lab-confirmed cases were reported to ADHS during the 2008-2009 season.

Lab-Confirmed RSV Cases Reported by County:

Since October 2004, laboratories have been required to report positive RSV tests to ADHS.

County	Number of Laboratory-Confirmed Cases		
	2008-2009 Season	Last Week	Last 3 Weeks
Apache	0	0	0
Cochise	0	0	0
Coconino	1	1	1
Gila	0	0	0
Graham	0	0	0
